

Are you prepared for the world after the pandemic?

Crises are said to improve innovation introducing new ways to work and is also speeding up the development processes of new products. A criterion of success for the companies surviving the crisis is to be among the first to see new business opportunities coming up and to be ready to the marketing of new products as soon as the crisis is diminishing.

The TestPig team has been working without delay during the pandemic. We have found ways to protect ourselves and our customers against the virus making us able to keep up with our production plan as agreed upon with our customers. We feel certain that we have done our best to keep our customers in front by testing new products, e.g. new protein sources and new feed additives.

Lately TestPig is taking part in the study of a new protein source based on bacteria consuming methane. The amino acid profile looks like fish meal potentially making this product most valuable to piglets. At the same time, the environmental perspectives of reducing the amount of greenhouse gases when feeding bacterial protein to the pigs are tremendous. This project is managed by the University of Aarhus, TestPig being a subcontractor.

We wish you all a pleasant holiday.

TestPig* - Significantly better**

Our office is closed for summer holidays from **July 17, until August 3, 2020.**
